

ROUND BALER RECLAMATION BELT

ABSTRACT OF THE DISCLOSURE

A material reclaiming conveyor is positioned below the apron of a round baler. The
5 apron has a series of side by side bale forming belts that are spaced apart and form a bale chamber. The conveyor underlies an in-feed region to the bale chamber to catch material falling through the spaces between the bale forming belts and convey the
10 material forwardly, to be recycled into the in-feed region of the baler. A trough is provided under an in-feed drum to receive the material from the reclaiming conveyor and cause such material to be carried with the drum into the bale forming chamber.
